

Character Sheet Prompts

✓ REVISED PROMPTS

1 Photorealistic Character Identity Sheet (Using a Reference Image)

Prompt

Create a photorealistic multi-angle photographic identity sheet based strictly on the uploaded reference image.

- Match the exact real-world appearance of the person: facial structure, proportions, skin texture, age, asymmetry, and natural imperfections.
- The result must look like real photography of a real human , not a digital character or 3D asset.
- Use a simple, neutral background , similar to a studio or indoor wall.
- The overall feeling should be documentary and natural , not stylized or cinematic.

Layout

- Two horizontal rows , presented as a clean photo contact sheet.
- Top row: four full-body photographs of the same person:
 1. Facing the camera
 2. Left-facing profile
 3. Right-facing profile
 4. Facing away from the camera
- Bottom row: three close-up photographic portraits:
 1. Facing the camera
 2. Left-facing profile
 3. Right-facing profile

Pose & Body Language

- The subject stands naturally and casually , as a real person would when asked to stand still.
- No exaggerated stance, no rigid pose, no symmetry.
- Subtle, natural weight distribution and relaxed posture.
- Shoulders relaxed, arms resting naturally at the sides.

Consistency & Accuracy

- Maintain strong identity consistency across all images.
- Preserve natural human asymmetry.
- Proportions must remain realistic and consistent without looking mechanically aligned.
- The subject should feel like the same person photographed multiple times , not a replicated model.

Lighting & Camera

- Soft, neutral, real-world lighting (similar to window light or soft studio light).
- No dramatic, cinematic, or stylized lighting.
- Natural shadows with gentle falloff.
- Realistic camera perspective and lens behavior.

Critical constraints

- Not a 3D render
- Not CGI
- Not a game character
- Not stylized
- Not a model turnaround

2 Photorealistic Character Identity Sheet (No Reference Image)

Prompt

Create a photorealistic photographic identity sheet of the following person:

[INSERT REALISTIC HUMAN DESCRIPTION HERE]

- The subject must look like a real human photographed in the real world .
- Avoid any stylized, animated, or synthetic appearance.
- Use a simple neutral background , similar to an ID or documentary shoot.

Layout

- Two horizontal rows , presented as a photo contact sheet.
 - Top row: four full-body photographs:
 1. Facing the camera
 2. Left-facing profile
 3. Right-facing profile
 4. Facing away
 - Bottom row: three close-up portraits:
 1. Facing the camera
 2. Left-facing profile
 3. Right-facing profile

Pose & Presence

- Natural stance, relaxed posture.
- No posing for presentation.
 - Subtle variation in head angle and body balance, like multiple photos taken moments apart.

Lighting & Finish

- Soft, neutral, realistic lighting.
- No stylization, no dramatic contrast.
- The final result should resemble real reference photography , not a character asset.

3 Changing Wardrobe (Photorealistic Edit)

Prompt

Use the same photographic identity sheet as reference.

- Maintain the exact same person : face, body, age, proportions, posture, and expression.
- Change only the clothing to the following:

[INSERT OUTFIT DESCRIPTION OR REFERENCE IMAGE]

Constraints

- The clothing must behave like real fabric on a real body.
- No change to lighting, camera angle, or body posture.

- The person should still feel like the same individual photographed on the same day, just wearing different clothes.
- No stylization, no CGI look, no character redesign.

🔑 Why this works

- “Photographic identity sheet” replaces “character reference sheet”
- “Contact sheet” replaces “model turnaround”
- Natural posture replaces A-pose
- Identity consistency without mechanical perfection
- Explicit suppression of CG language

This keeps consistency but restores human realism .

Next useful steps (your call)

I can:

- compress these into Nano Banana–optimized short prompts
- create a tight negative prompt block
- build a stress-test prompt to validate realism
- or adapt this for video identity continuity
